

When it comes to what Graphical User Interface and Command User Interface have in common, I had to look up what both of those terms meant. However, if I remember my coding class in high school then I believe that GUI is the most popular because it is the easiest to navigate because of its set in stone maps and icons. CUI is more popular in the coding world because I believe it is made up of commands and a script that can be written and edited. Not to say that GUI cant be edited and such but I believe it's done in a different way. When you want to get to a specific page in GUI, you just click the "click here" box and it will take you there, but with CUI, I think you have to manually type something such as, "> go to page 6".

I could be entirely and embarrassingly wrong but that is my grasp of both concepts as of this moment in time.
